

INTRODUCTION TO ANGULAR

- Angular is a TypeScript-based framework
 - It is used for building single-page applications, progressive web apps, and mobile applications
 - Angular has a large community of developers
 - It has a wide range of tools and libraries
 - It supports two-way data binding
-

SETTING UP THE DEVELOPMENT ENVIRONMENT

- Install Node.js and npm
 - Install the Angular CLI
 - Create a new Angular project using the Angular CLI
 - Understand the project structure
 - Know how to run and build the application
-

COMPONENTS AND TEMPLATES

- Components are the building blocks of an Angular application
 - Templates are used to define the user interface for a component
 - The component lifecycle includes several events
 - Directives are used to extend the behavior of HTML elements
 - You can use HTML, CSS, and Angular directives to create a template
-

SERVICES AND DEPENDENCY INJECTION

- Services are used to share data between components
 - Dependency injection is a design pattern that allows you to inject dependencies into a component
 - Services are used to encapsulate business logic and to provide a way to interact with external systems
 - Dependency injection is used to decouple the component from the dependency and to make the component more testable
 - You can use services to share data between components
-

ROUTING AND NAVIGATION

- Routing is used to navigate between components in an Angular application
 - Navigation is used to navigate between routes
 - You can use the RouterModule to define routes
 - Route parameters are used to pass data between routes
 - Route guards are used to control access to routes
-
